Overview

The Agentic Platform provides two ways to build AI agent applications, each offering different levels of control and customization. Choose the approach that best fits your needs based on your requirements for customization, control, and development complexity.

Approaches to Building AI Agent Apps

1. Embedding the Trimble Assist UI

Best for: Shipping an in-app AI experience quickly with minimal frontend complexity

Embedding the Trimble Assist UI means rendering the Assist chat experience inside your application so users can stay in your product while interacting with agents. You can integrate it in two ways:

- **Framework Components (Recommended):** The easiest path for React/Angular projects, with lifecycle and messaging handled for you.
- **Direct iFrame (Alternative):** A lower-level path for teams that need advanced control over integration details.

Key Features:

- Pre-built, fully functional UI
- Minimal configuration required
- Automatic updates and maintenance
- Built-in authentication and session management

2. TypeScript SDK (Medium Complexity)

Best for: Custom UI with SDK support, more control over the user experience

Use the TypeScript SDK to integrate Trimble Assist functionality into your own custom UI while leveraging the platform's built-in capabilities.

Key Features:

- Full control over UI/UX design
- Access to SDK helpers and utilities
- Bi-directional communication with the platform
- Custom tool callbacks and event handling

Choosing the Right Approach

Approach	Setup Effort	Customization	Control	Best For
Embed Trimble Assist UI	Low	Limited	Low	Quick prototypes, standard use cases
TypeScript SDK	Moderate	High	Medium	Custom UI with platform features
